Office Action Comment	09/772,149	BARNARD ET AL.					
Office Action Summary	Examiner	Art Unit					
	Brandon S. Hoffman	2136					
The MAILING DATE of this communication app Period for Reply	The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).							
Status							
1) Responsive to communication(s) filed on <u>28 O</u>	<u>ctober 2004</u> .	•

DETAILED ACTION

1. Claims 1-20 are pending in this office action.

2. Applicant's arguments, filed October 28, 2004, have been considered and are persuasive. However, a new ground of rejection is made in view of ECMA-267, Yoon, and Yokota et al.

Rejections

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 103

4. <u>Claims 1-20</u> are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>ECMA-267 2nd edition</u> (hereinafter, ECMA) in view of <u>Yoon</u> (U.S. Patent Pub. No. 2002/0004832 A1), and further in view of <u>Yokota et al.</u> (U.S. Patent No. 6,907,184).

Regarding <u>claims 1, 3, and 15, ECMA</u> teaches a copy-protected optical disc/method for copy-protecting information recorded on an optical disc, comprising:

 A preformed identification number (ID) that is impressed upon the optical disc and a number of other optical discs during optical disc manufacture (Annex J, the SID code); Art Unit: 2136

 A unique identification number for the optical disc which was written on the optical disc after it is manufactured (Annex H, first section, the BCA is unique to each CD).

ECMA does not specifically teach that the preformed ID is in the ATIP signal and the subcode and an encrypted program written onto the optical disc wherein the encryption of such program is based upon the preformed ID and the unique ID and includes two or more selectable security levels.

Yoon teaches the preformed ID is in the ATIP signal and the subcode (paragraph 0037).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine storing ID's in the ATIP signal and the subcode, as taught by <u>Yoon</u>, with the disc/method of <u>ECMA</u>. It would have been obvious for such modifications because the ATIP signal is existent on a blank medium, thus allowing an ID to exist before any data has been written.

The combination of <u>ECMA/Yoon</u> still does not teach an encrypted program based on the preformed ID and unique ID.

Page 4

Yokota et al. teaches an encrypted program written onto the optical disc wherein the encryption of such program is based upon the preformed ID and the unique ID and includes two or more selectable security levels (col. 4, line 66 through col. 5, line 11).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine encrypting programs using the preformed ID and the unique ID, as taught by <u>Yokota et al.</u>, with the disc/method of <u>ECMA/Yoon</u>. It would have been obvious for such modifications because the combination of a master key and a unique key provides a unique encryption key to provide more secure encryption.

Regarding <u>claims 2 and 4</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u> teaches further including the preformed ID recorded in the data stream (see paragraph 0037 of Yoon).

Regarding <u>claim 5</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>

teaches wherein the preformed ID includes the maximum start of lead-in and the start of lead-out for the disc; the preformed ID is recorded in special information and special information of the ATIP signal (see paragraph 0037 of Yoon).

Regarding <u>claim 6</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>
teaches further including the step of reading the preformed ID and the unique ID from the disc and decrypting the encrypted program using the preformed ID and the unique

Application/Control Number: 09/772,149

Art Unit: 2136

ID (see col. 4, line 66 through col. 5, line 11 of Yokota et al., symmetric encryption/decryption uses the same key for both processes).

Regarding <u>claim 7</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u> teaches in which the unique ID is recorded at one or more known absolute sector addresses on the disc (see Annex H, BCA, section H.1 of ECMA).

Regarding <u>claim 8</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>
teaches in which the unique ID is recorded into the second session (see Annex H, BCA, section H.1 of ECMA).

Regarding <u>claim 9</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>
teaches in which the disc further includes a recordable area (based on the fact the ATIP signals only exist on recordable mediums, there must be a recordable area).

Regarding claims 10 and 11, the combination of ECMA in view of Yoon/Yokota et al. teaches a copy-protection system including a computer, the copy-protected optical disc of claim 1, and an encrypting program capable of reading the preformed ID and the unique ID from the copy-protected optical disc of claim 1 and encrypting a customer program using them (see col. 4, line 66 through col. 5, line 11 of Yokota et al., paragraph 0037 of Yoon).

Regarding <u>claim 12</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>
teaches in which an encrypting program is pressed onto the copy-protected optical disc (see paragraph 0037 and fig. 3 of Yoon).

Regarding <u>claim 13</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u>
teaches in which the encrypting program is located on another computer system or on a network (see col. 4, line 66 through col. 5, line 11 of Yokota et al., the computer that encrypts the data is located on a different computer than the one that will read the data).

Regarding claim 14, the combination of ECMA in view of Yoon/Yokota et al. teaches further including: reading the Drive ID of the CD-ROM drive to determine whether it is a reader/writer or a reader only; and using that information to determine which preformed ID may be used in accordance with the predetermined security level (see fig. 1, ref. num 13 of Yokota et al.).

Regarding claims 16-18, the combination of ECMA in view of Yoon/Yokota et al. teaches with the decrypting program reading the preformed ID from the ATIP signal, the subcode, and the at least one known absolute sector address (see col. 4, line 66 through col. 5, line 11 of Yokota et al., symmetric encryption/decryption uses the same key for both processes).

Application/Control Number: 09/772,149

Art Unit: 2136

Regarding <u>claim 19</u>, the combination of <u>ECMA</u> in view of <u>Yoon/Yokota et al.</u> teaches in which valid values of the unique ID correspond to only a small part of the range of possible numbers (see paragraph 0037 of Yoon, the serial numbers only span a small range of possible numbers).

Regarding <u>claim 20</u>, <u>ECMA</u> teaches a uniquely identified programmable CD-ROM optical disc, comprising:

- A first preformed ID which is formed (Annex J, the SID code); and
- A unique ID which is written in the recordable area at a known absolute sector address (Annex H, first section, the BCA is unique to each CD).

ECMA does not specifically teach that the first preformed ID is formed in the ATIP signal and a second preformed ID is formed in the subchannel data in the lead-in zone of the first session.

Yoon teaches the preformed ID is in the ATIP signal and the subchannel data (paragraph 0037).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine storing ID's in the ATIP signal and the subcode, as taught by <u>Yoon</u>, with the disc/method of <u>ECMA</u>. It would have been obvious for such

modifications because the ATIP signal is existent on a blank medium, thus allowing an ID to exist before any data has been written.

The combination of ECMA/Yoon still does not teach a second preformed ID.

Yokota et al. teaches a second preformed ID (col. 4, line 66 through col. 5, line 11).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine a second preformed ID, as taught by Yokota et al., with the method of ECMA/Yoon. It would have been obvious for such modifications because a second ID allows combination with a first ID to create a unique encryption key.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brandon S. Hoffman whose telephone number is 571-272-3863. The examiner can normally be reached on M-F 8:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz R. Sheikh can be reached on 571-272-3795. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
